NATIONAL INSTITUTE OF TECHNOLOGY WARANGAL

DATABASE MANAGEMENT SYSTEM PROJECT ON BLOOD BANK MANAGEMENT DATABASE

BY :

KUKUDALA SRISHANTH REDDY- 21CHB0B37

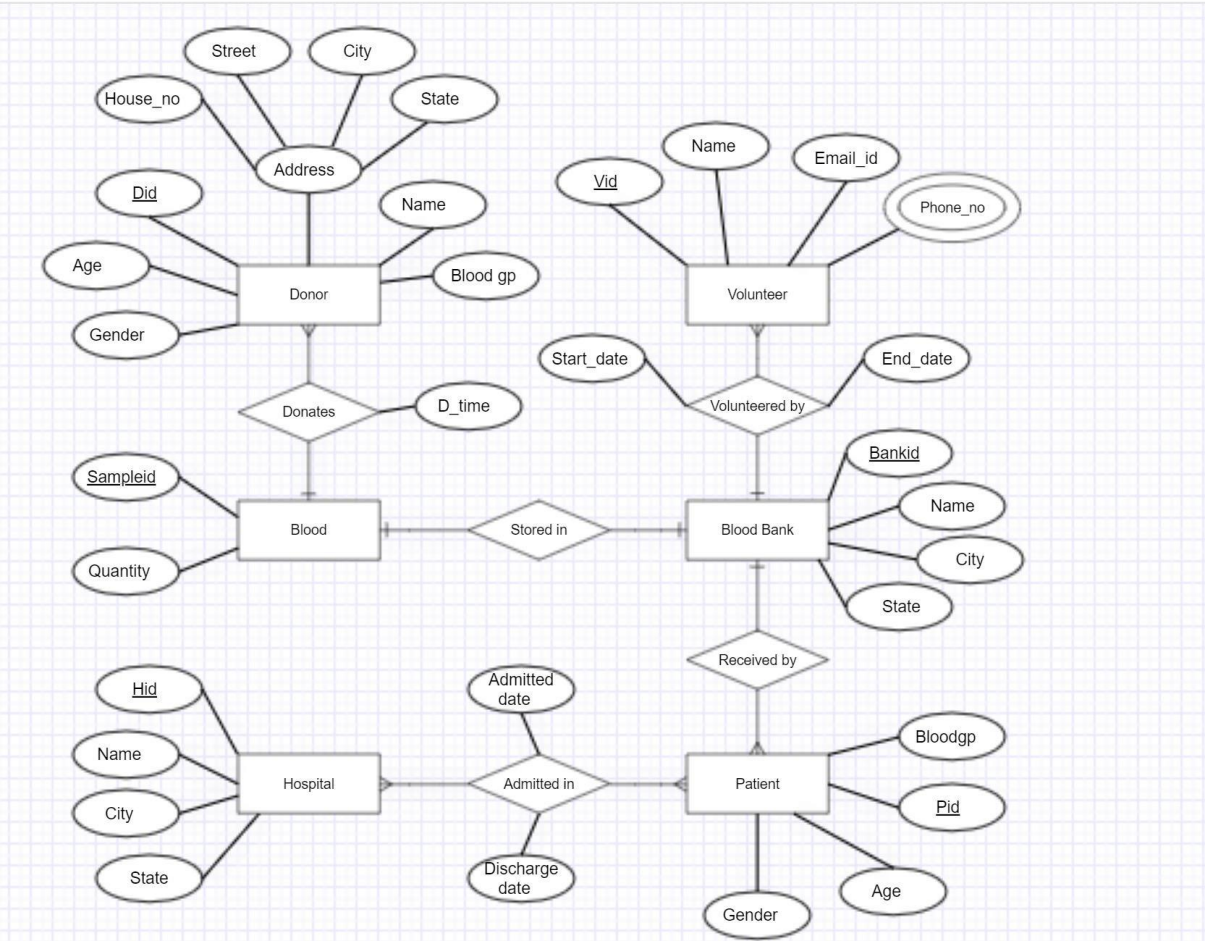
PROBLEM STATEMENT AND DESCRIPTION:

The 'BLOOD BANK MANAGEMENT SYSTEM' project is to connect all blood banks, hospitals, and donors into a single network, validate data, and preserve information on each person's blood. This technique is used to store data on a centralised server that has a database that no one else can access.

It focuses on these entities and relationship between them with all key constraints and participation constraints.

CONTENTS:

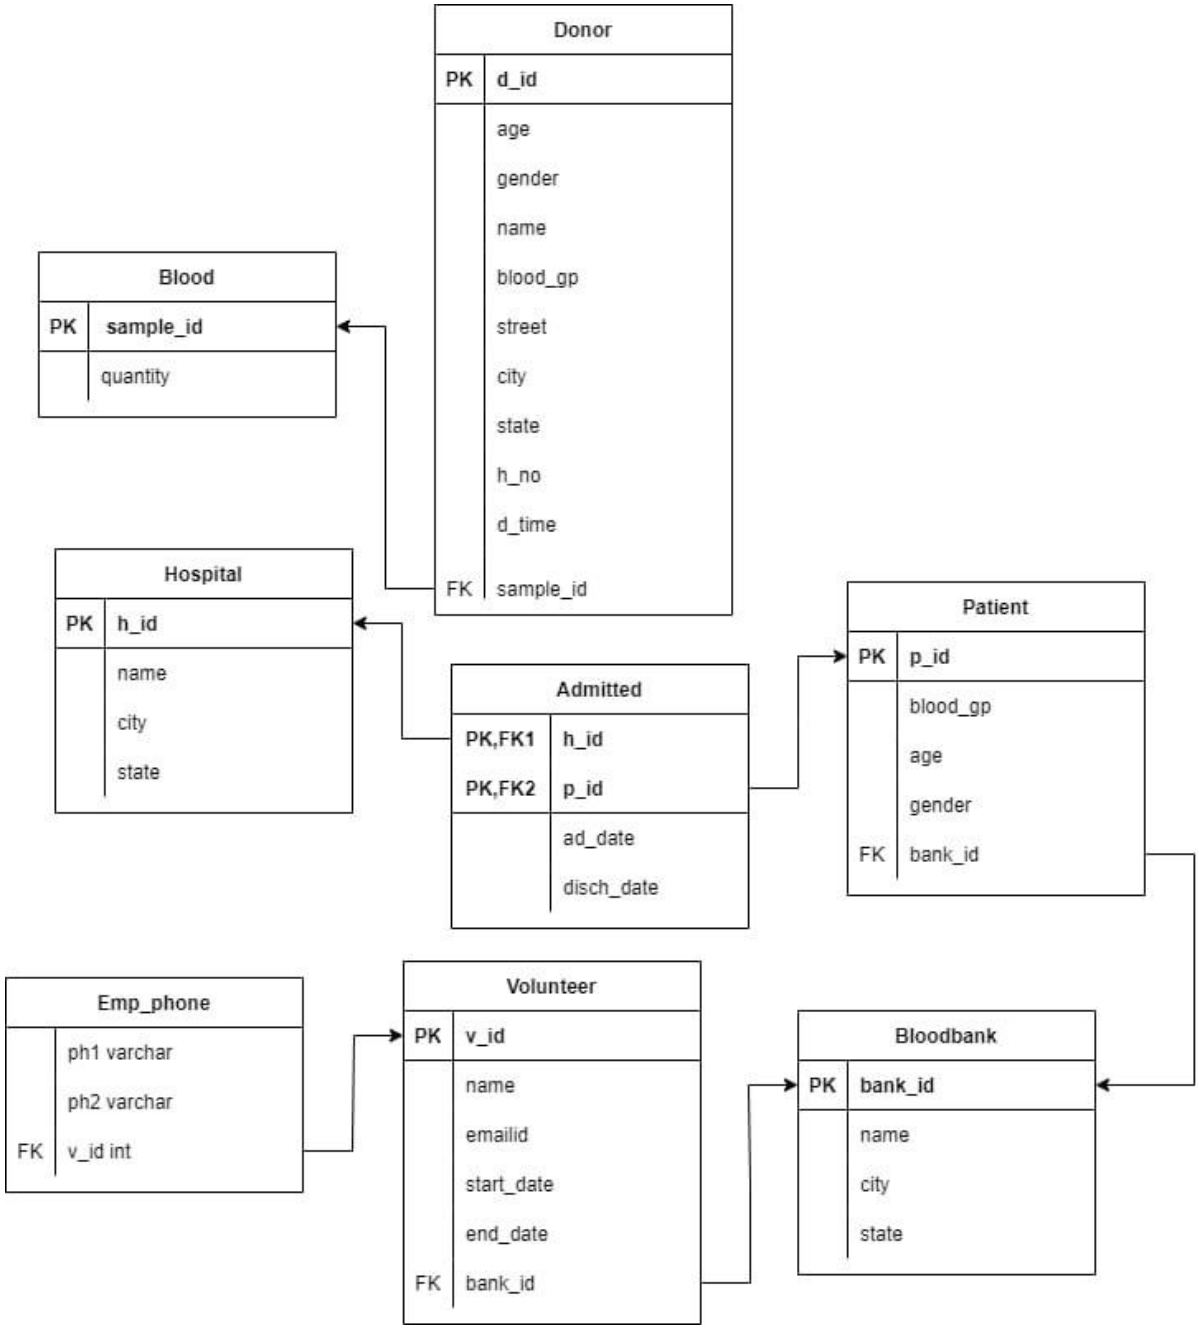
ER DIAGRAM:



RELATIONSHIPS:

Entity1	Entity2	Relationship name	Relation
Donor	Blood	Donates	Many to one
Blood	Blood Bank	Stored in	one to one
Blood Bank	Volunteer	Volunteered by	One to many
Blood Bank	Patient	Received by	One to many
Patient	Hospital	Admitted in	Many to many

RELATIONAL SCHEMA :



FUNCTIONAL DEPENDENCIES AND NORMALISATION

BLOOD :

Address attribute is a composite attribute. So, we represent all the derived attributes in the relation in tuples. Finally, this ensures atomicity. So, it is in 1nf.

The functional dependencies are sample_id->sample_id,quantity.

The relation does not have any partial dependencies. So, it is in 2nf.

The relation does not have any transitive dependencies. So, it is in 3nf.

The table is in bcnf.

DONOR :

The functional dependencies are

1)d_id →age,d_time,gender,name,blood_group,house_no,street,city,state

2)city → state

It satisfies 2nf but not 3nf due to transitive dependency of city → state

So now, we decompose the relation into two relations r1(contains all attributes except state),r2(city(pk),state)

By this decomposition we will achieve both relations will be in 3nf and bcnf

BLOOD BANK :

The functional dependencies are

1) bank_id → state,name,city

2) city → state

It satisfies 2nf but not 3nf due to transitive dependency of city → state

So now, we decompose the relation into two relations r1(contains all attributes except state),r2(city(pk),state)

By this decomposition we will achieve both relations will be in 3nf and bcnf.

PATIENT :

The functional depencies are p_id → blood_group,age,gender.

The relation does not have any partial dependencies. So, it is in 2nf.

The relation does not have any transitive dependencies. So, it is in 3nf.

The table is in bcnf.

HOSPITAL :

The functional dependencies are 1)h-id

→ state,name,city.

2)city → state

It satisfies 2nf but not 3nf due to transitive dependency of city → state

So now, we decompose the relation into two relations r1(contains all attributes except state),r2(city(pk),state)

By this decomposition we will achieve both relations will be in 3nf and bcnf .

VOLUNTEER :

The functional dependencies are

V_id → name,email_id,start_date,end_date,bank_id,V_id.

The relation does not have any partial dependencies. So, it is in 2nf.

The relation does not have any transitive dependencies. So, it is in 3nf.

The table is in bcnf.

EMP_PHONE :

It is a multi value attribute.so, we created a new table. Now it is in 1nf.

The functional dependencies are Emp_id → ph1,ph2,v_id.

The relation does not have any partial dependencies. So, it is in 2nf.

The relation does not have any transitive dependencies. So, it is in 3nf.
The table is in bcnf.

ADMITTED :

The functional dependencies are

P_id h_id → ad_date,discharge_date.

The relation does not have any partial dependencies. So, it is in 2nf.
The relation does not have any transitive dependencies. So, it is in 3nf.
The table is in bcnf

TABLES CREATION AND VALUES INSERTION :

create table **blood2**(sample_id int primary key,quantity int);
insert into blood2 values(101,100); insert into blood2 values(102,200); insert into blood2 values(103,300); insert into blood2 values(104,400); insert into blood2 values(105,500); insert into blood2 values(106,600); insert into blood2 values(107,700);

	SAMPLE_ID	QUANTITY
1	101	100
2	102	200
3	103	300
4	104	400
5	105	500
6	106	600
7	107	700

create table **donor2**(did int primary key,age int,d_time date,gender char,name varchar(15),blood_gp varchar(5), h_no int ,street varchar(15) ,city varchar(10) , state varchar(15), sample_id references blood2(sample_id));

insert into donor2 values(201,23,to_date ('01-01-2022','DDMM-YYYY'),'F','nisha','B',24,'chandanagar','warangal','AP',102); insert into donor2 values(202,24,to_date ('02-02-2022','DD-MM-YYYY'),'M','pavan','O',23,'gandhinagar','hyderabad','telangana',101);

insert into donor2 values(202,25,to_date ('03-03-2022','DDMM-YYYY'),'F','akansha','AB',25,'miyapur','mumbai','TN',103); insert into donor2 values(204,26,to_date ('04-04-2022','DD-MM-YYYY'),'M','shashank','A',26,'hydernagar','chennai','KN',104);

insert into donor2 values(205,27,to_date ('05-05-2022','DD-MM-

YYYY'),'M','deepak','O',27,'lingampally','bangalore','MH',105); insert into donor2 values(206,28,to_date ('06-06-2022','DDMM-YYYY'),'F','devika','A',28,'uppal','delhi','punjab',106);

Query Result

SQL | All Rows Fetched: 5 in 0.005 seconds

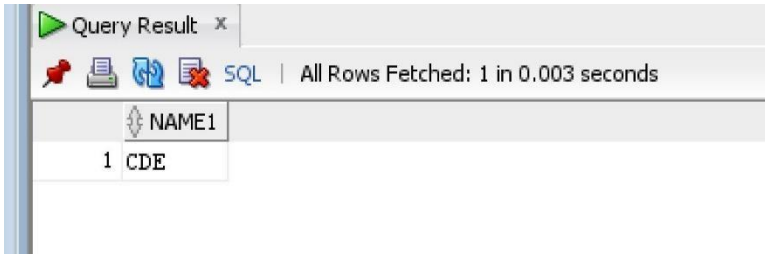
QUERIES:

1.Find the names of bloodbanks which are present in Warangal?

select name1 from bloodbank2 where city='warangal';



Query Result

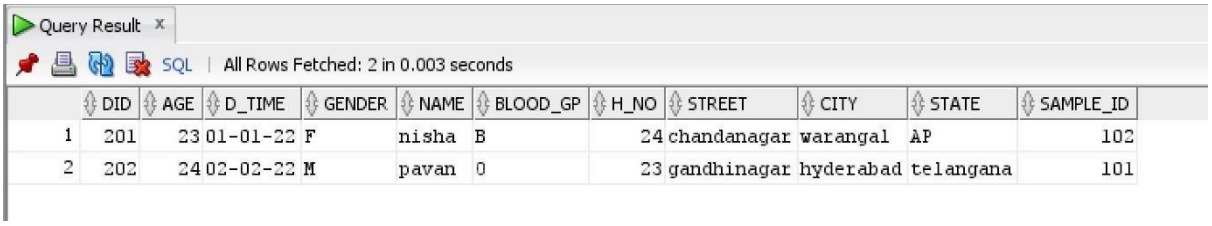
SQL | All Rows Fetched: 1 in 0.003 seconds

	NAME1
1	CDE

2.Find the donors whose age < 25?

select * from donor2 where age <

25;



Query Result

SQL | All Rows Fetched: 2 in 0.003 seconds

	DID	AGE	D_TIME	GENDER	NAME	BLOOD_GP	H_NO	STREET	CITY	STATE	SAMPLE_ID
1	201	23	01-01-22	F	nisha	B	24	chandanagar	warangal	AP	102
2	202	24	02-02-22	M	pavan	O	23	gandhinagar	hyderabad	telangana	101

3.Find the patients who has rare blood group ?

select * from patient2 where

blood_gp='AB';

Query Result

SQL | All Rows Fetched: 2 in 0.042 seconds

	BLOOD_GP	P_ID	AGE	GENDER	BANK_ID
1	AB	403	33	F	303
2	AB	407	37	F	307

4.Find donor,patient pairs which has correct blood_type for transmission?

```
select d.did as donor,p.p_id as patient
from donor2 d,patient2 p  where
p.blood_gp=d.blood_gp;
```

Query Result

SQL | All Rows Fetched: 8 in 0.05 seconds

	DONOR	PATIENT
1	204	401
2	206	401
3	201	402
4	202	404
5	205	404
6	202	405
7	205	405
8	201	406

5. Find names of patients who were admitted after 01-03-2022 and diacharged before 01-05-2022?

```
select hospital2.h_id from hospital2,admitted2
where admitted2.ad_date > to_date('01-03-2002','dd-mm-yyyy')
and
admitted2.disch_date < to_date('01-05-2022','dd-mm-yyyy');
```
